

Payment App

The growing number of smartphone devices has shown possibilities for new applications in the parking industry. Installations where the identification is done with license plates or bay numbers can be extended with a new payment type, via smartphone. Using online enforcement tools, this new payment App is ticketless and very intuitive for all users.

Payment App – License plate and Bay number applications

A typical parking meter experience requires the customer to walk to the parking machine and buy a ticket, then return to the car and display the ticket. Using this new payment app, the customer can buy a ticket and start the process from a smartphone device using his own license plate or bay number as the identifier.

Our new Payment App has a modern design, is intuitive and user friendly and runs on Android and iOS devices.

Payment App is fully customizable for parking operators allowing bespoke screen style, background and logos to be easily modified.

Customers can pay for parking through the App using credit cards without any prior registration. An alert can be easily configured to notify users of ticket expiration.

Our goal was to create a mobile application that not only made parking easier for parkers but for parking enforcement officers too. All parking ticket information is available on Hectronic's parking Enforcement web tool.

Payment App

Achievements

No registration needed. Customer downloads App from AppStore or Google Play Store and start payment.

All credit card payments are processed directly on a secure Payment Provider website.

Customer can check his payments every time in “History” area where he can filter his payments by Date. If needed, all payments can be sent per email in a customized PDF format to the customer. To achieve this, an email must be defined in “My profile” area.

A live tutorial is available any time for the customer.
